This function symmetrically saturates a reference value based on the maximum allowed value. If the reference value exceeds the maximum allowed value, it is saturated to the maximum value. If the reference value is less than the negative of the maximum allowed value, it is saturated to the negative of the maximum value.

Parameters

in	*ref*	The reference value to saturate.
in	*max*	The maximum allowed value for saturation.

Returns

The saturated reference value.

4.17.2.4 set_torque_direction()

```
float set_torque_direction (
            float torqueRefIn,
            int8_t direction )
```

Set torque direction based on inverter direction.

This function adjusts the torque reference based on the direction of the inverter. If the inverter is set to rotate counterclockwise (CCW), positive torque represents braking. If the inverter is set to rotate clockwise (CW), positive torque represents traction.

Parameters

in	*torqueRef*	The torque reference value to adjust.
in	*direction*	Pointer to the direction of the inverter (1 for CW, -1 for CCW).

Returns

The adjusted torque reference value.

This function adjusts the torque reference based on the desired direction. If the motor is set to rotate counterclockwise (CCW), positive torque represents traction, negative is braking. If the motor is set to rotate clockwise (CW), negative torque represents traction, positive is braking.

Parameters

in	*torque↩ RefIn*	The torque reference value to adjust.
in	*direction*	Pointer to the direction of the inverter (1 for CW, -1 for CCW).

Returns

torqueRefOut The adjusted torque reference value.

4.28.2 Function Documentation

4.28.2.1 get_currents_voltage()

```
uint8_t get_currents_voltage (
            volatile uint32_t ADC_raw[],
            volatile Analog * analog,
            volatile Feedback * feedback,
            float sinTheta_e,
            float cosTheta_e )
```

Get electrical ADC measurements.

Parameters

in	*ADC_raw*	Pointer to the raw ADC values array.
out	*analog*	Pointer to the ADC struct to store the results.
out	*feedback*	Pointer to the Feedback struct to store id and iq.
in	*sinTheta_e*	Electrical angle sine (-1..1)
in	*cosTheta_e*	Electrical angle cosine (-1..1)

Return values

OK	0 if an error occurred, 1 if successful.

4.28.2.2 get_idiq()

```
void get_idiq (
            float ia,
            float ib,
            float ic,
            float sinTheta_e,
            float cosTheta_e,
            float * idMeas,
            float * iqMeas )
```

Computes d-q currents from current measurements and electrical angle.

This function computes the d-q currents from phase currents (ABC), theta_e, and stores the results in the provided pointers.

Parameters

in	*ia*	Phase A current in A.
in	*ib*	Phase B current in A.
in	*ic*	Phase C current in A.
in	*sinTheta_e*	Electrical angle sine (-1..1)
in	*cosTheta_e*	Electrical angle cosine (-1..1)
out	*idMeas*	Pointer to store the D-axis current.
out	*iqMeas*	Pointer to store the Q-axis current.

4.28.2.3 get_linear()

```
float get_linear (
            uint32_t bits,
            float slope,
            float offset )
```

Convert ADC reading to physical measurement with linear response.

Parameters

in	*bits*	The ADC reading.
in	*slope*	The slope (units per volt).
in	*offset*	The offset (volts at zero).

Return values

measurement	The physical measurement.

4.28.2.4 get_temperature()

```
float get_temperature (
            uint32_t bits,
            const float tempLUT[] )
```

Retrieves temperature from a lookup table based on ADC bits.

This function retrieves temperature from a lookup table based on the ADC bits. The lookup table (LUT) must have a value for each possible ADC bit combination.

Parameters

in	*bits*	ADC reading converted to bits.
in	*tempLUT*	Lookup table containing temperature values.

Returns

Temperature corresponding to the provided ADC bits.

```
void handle_direction (
            volatile int8_t * dir_left,
            volatile int8_t * dir_right )
```

Handles the direction of the motors.

This function reads the state of the DIR switch and updates the directions of both the left and right motors. If one motor is set to rotate clockwise (CW), the other one is set to rotate counterclockwise (CCW), and vice versa.

Parameters

dir_left	Pointer to the direction parameter in the left inverter structure.
dir_right	Pointer to the direction parameter in the right inverter structure.

4.32.2 Function Documentation

4.32.2.1 handle_torqueRef()

```
float handle_torqueRef (
            float torqueRefIn,
            int8_t direction,
            float torqueMax,
            float speedMaxRPM,
            float speedMeas,
            volatile pi_struct * loopSpeed )
```

Handles torque control based on the reference torque, direction, maximum torque, maximum speed, measured speed, maximum torque rate of change, speed control loop parameters, and sampling time.

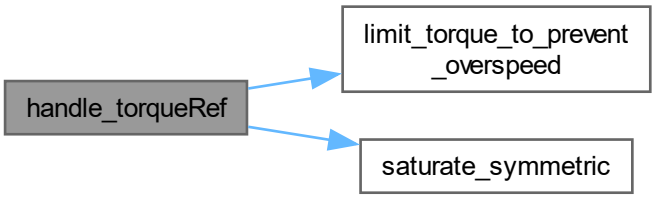
Parameters

torqueRefIn	Input reference torque.
direction	Direction of torque (1 for positive torque, -1 for negative torque).
torqueMax	Maximum allowable torque.
speedMaxRPM	Maximum allowable speed in RPM.
speedMeas	Measured speed.
loopSpeed	Speed control loop parameters.

Returns

The output torque after handling direction, saturation, and rate limiting.

Here is the call graph for this function:



Here is the caller graph for this function:

4.32.2.2 limit_torque_to_prevent_overspeed()

```
float limit_torque_to_prevent_overspeed (
            float speedMaxRPM,
            float speedMeas,
            float torqueRefIn,
            volatile pi_struct * loopSpeed )
```

Speed loop acts as a torque saturation, reducing torque in order to limit the maximum speed.

Parameters

in	*speedMaxRPM*	The maximum speed value in RPM.
in	*speedMeas*	The measured speed value in RPM.
in	*torqueRefIn*	The torque reference value before this saturation.
in	*loopSpeed*	Pointer to the speed PI controller structure.

Returns

torqueRefOut The limited torque reference value after this saturation.

Here is the caller graph for this function:

4.32.2.3 saturate_symmetric()

```
float saturate_symmetric (
            float ref,
            float max )
```

Symmetrically saturate a reference value.

This function symmetrically saturates a reference value based on the maximum allowed value. If the reference value exceeds the maximum allowed value, it is saturated to the maximum value. If the reference value is less than the negative of the maximum allowed value, it is saturated to the negative of the maximum value.

Parameters

in	*ref*	The reference value to saturate.
in	*max*	The maximum allowed value for saturation.

Returns

The saturated reference value.

Here is the caller graph for this function:

4.32.2.4 set_torque_direction()

```
float set_torque_direction (
            float torqueRefIn,
            int8_t direction )
```

Set torque direction based on inverter direction.

This function adjusts the torque reference based on the desired direction. If the motor is set to rotate counterclockwise (CCW), positive torque represents traction, negative is braking. If the motor is set to rotate clockwise (CW), negative torque represents traction, positive is braking.

Parameters

in	*torque↩ RefIn*	The torque reference value to adjust.
in	*direction*	Pointer to the direction of the inverter (1 for CW, -1 for CCW).

Returns

torqueRefOut The adjusted torque reference value.
