- void [SystemCoreClockUpdate](#) (void)
Update SystemCoreClock variable according to Clock Register Values. The SystemCoreClock variable contains the core clock (HCLK), it can be used by the user application to setup the SysTick timer or configure other parameters.

4.1.2.8.1 Detailed Description

4.1.2.8.2 Function Documentation

4.1.2.8.2.1 SystemCoreClockUpdate()

```
void SystemCoreClockUpdate (
    void )
```

Update SystemCoreClock variable according to Clock Register Values. The SystemCoreClock variable contains the core clock (HCLK), it can be used by the user application to setup the SysTick timer or configure other parameters.

Note

Each time the core clock (HCLK) changes, this function must be called to update SystemCoreClock variable value. Otherwise, any configuration based on this variable will be incorrect.

- The system frequency computed by this function is not the real frequency in the chip. It is calculated based on the predefined constant and the selected clock source:

- If SYSCLK source is HSI, SystemCoreClock will contain the [HSI_VALUE\(*\)](#)
- If SYSCLK source is HSE, SystemCoreClock will contain the [HSE_VALUE\(**\)](#)
- If SYSCLK source is PLL, SystemCoreClock will contain the [HSE_VALUE\(**\)](#) or [HSI_VALUE\(*\)](#) multiplied/divided by the PLL factors.

(*) HSI_VALUE is a constant defined in [stm32f7xx_hal_conf.h](#) file (default value 16 MHz) but the real value may vary depending on the variations in voltage and temperature.

(**) HSE_VALUE is a constant defined in [stm32f7xx_hal_conf.h](#) file (default value 25 MHz), user has to ensure that HSE_VALUE is same as the real frequency of the crystal used. Otherwise, this function may have wrong result.

- The result of this function could be not correct when using fractional value for HSE crystal.

6.50.2 Function Documentation

6.50.2.1 [_sbrk\(\)](#)

```
void * _sbrk (
    ptrdiff_t incr )
```

[_sbrk\(\)](#) allocates memory to the newlib heap and is used by malloc and others from the C library

```
* #####
* # .data # .bss #          newlib heap          #          MSP stack          #
* #          #          #          #          # Reserved by _Min_Stack_Size #
* #####
* ^-- RAM start          ^-- _end          _estack, RAM end --^
*
```

This implementation starts allocating at the '_end' linker symbol The '_Min_Stack_Size' linker symbol reserves a memory for the MSP stack The implementation considers '_estack' linker symbol to be RAM end NOTE: If the MSP stack, at any point during execution, grows larger than the reserved size, please increase the '_Min_Stack_Size'.

Parameters

<i>incr</i>	Memory size

Returns

Pointer to allocated memory

This file provides two functions and one global variable to be called from user application:

- [SystemInit\(\)](#): This function is called at startup just after reset and before branch to main program. This call is made inside the "startup_stm32f7xx.s" file.
- SystemCoreClock variable: Contains the core clock (HCLK), it can be used by the user application to setup the SysTick timer or configure other parameters.
- [SystemCoreClockUpdate\(\)](#): Updates the variable SystemCoreClock and must be called whenever the core clock is changed during program execution.
