Functions

• void calc_current_reference (MotorParameters *motor, volatile Reference *reference)

Calculates the current references using a FOC algorithm. It computes the current vector for the MTPA trajectory and limits the current reference to isMaxRef (calculated by derating, starting from the motor's maximum current). The MTPV trajectory is not implemented to save some computation time due to the nature of the motors expected. In order to implement field weakening, an external voltage loop modifying gammaRef is needed and should be called inside here. When implementing field weakening, special attention must be put to the torque reference being near 0 or differing from the speed sign (regeneration). A minimum id current must be set for speeds higher than Vs/lambda. Study thoroughly, simulate first.

void calc_current_loop (volatile InverterStruct *inv)

Calculates the id-iq loops.

4.13.3 Function Documentation

4.13.3.1 calibrate_offsets()

Calibrate the current sensor offsets.

This function calculates the average offset for each current sensor channel by reading the ADC values when no current is flowing. The calculated offsets are used to correct the sensor readings.

Parameters

• void calc_current_reference (MotorParameters *motor, volatile Reference *reference)

Calculates the current references using a FOC algorithm. It computes the current vector for the MTPA trajectory and limits the current reference to isMaxRef (calculated by derating, starting from the motor's maximum current). The MTPV trajectory is not implemented to save some computation time due to the nature of the motors expected. In order to implement field weakening, an external voltage loop modifying gammaRef is needed and should be called inside here. When implementing field weakening, special attention must be put to the torque reference being near 0 or differing from the speed sign (regeneration). A minimum id current must be set for speeds higher than Vs/lambda. Study thoroughly, simulate first.

4.33.2 Function Documentation

4.33.2.1 calibrate_offsets()

Calibrate the current sensor offsets.

This function calculates the average offset for each current sensor channel by reading the ADC values when no current is flowing. The calculated offsets are used to correct the sensor readings.

Parameters

i	in <i>rawADC</i>		Buffer containing the raw ADC values for the channels.
C	out	currentOffsets	Array to store the calculated offsets for each current channel.
j	in	numSamples	Number of samples to average for the offset calculation.

Here is the caller graph for this function:

4.33.2.2 get_currents_voltage()

Get electrical ADC measurements.

Parameters

in	ADC_raw	Pointer to the raw ADC values array.
out	analog	Pointer to the ADC struct to store the results.
out	feedback	Pointer to the Feedback struct to store id and iq.
in	sinTheta⊷	Electrical angle sine (-11)
	_e	
in	cosTheta⇔	Electrical angle cosine (-11)
	_ <i>e</i>

Return values

```
OK 0 if an error occurred, 1 if successful.
```

4.33.2.3 get_idiq()

Computes d-q currents from current measurements and electrical angle.

This function computes the d-q currents from phase currents (ABC), theta_e, and stores the results in the provided pointers.

Parameters

ia	Phase A current in A.
ib	Phase B current in A.
ic	Phase C current in A.
sinTheta⇔	Electrical angle sine (-11)
_e	
cosTheta⇔	Electrical angle cosine (-11)
_e	
idMeas	Pointer to store the D-axis current.
iqMeas	Pointer to store the Q-axis current.
	ib ic sinTheta← _e cosTheta← _e idMeas

4.33.2.4 get_linear()

Convert ADC reading to physical measurement with linear response.

Parameters

in	bits	The ADC reading.
in	slope	The slope (units per volt).
in	offset	The offset (volts at zero).

Return values

measurement	The physical measurement.

Here is the caller graph for this function:

4.33.2.5 get_temperature()

Retrieves temperature from a lookup table based on ADC bits.

This function retrieves temperature from a lookup table based on the ADC bits. The lookup table (LUT) must have a value for each possible ADC bit combination.

Parameters

in	bits	ADC reading converted to bits.
in	tempLUT	Lookup table containing temperature values.

Returns

Temperature corresponding to the provided ADC bits.
